Welcome to the MGate 4101-MB-PBS line of Modbus to PROFIBUS gateways. All models feature easy protocol conversion from Modbus to PROFIBUS, and RS-232/422/485 ports for Modbus communication.

Overview

The MGate 4101-MB-PBS is a line of protocol gateways that provide users with the following features:

Protocol conversion between Modbus and PROFIBUS

MGate 4101-MB-PBS Series products can be used to connect Modbus devices and PROFIBUS devices to provide PLCs (ex. Siemens S400, S300) with remote maintenance capability.

Windows utilities for easy setup and traffic monitoring

A Windows utility is provided to make configuration and operation of the MGate 4101-MB-PBS as easy as possible. The utility uses serial console port to connect MGate 4101-MB-PBS unit. Besides, Wizard functions can help you finish configuration in only several minutes by automatic commands detection and automatic memory mapping.

Package Checklist

All models of the MGate 4101-MB-PBS Series are shipped with the following items:

Standard Accessories:

- 1 MGate 4101-MB-PBS Modbus Serial-to-PROFIBUS Slave Gateway.
- Quick Installation Guide (printed).
- Warranty card.
- RJ45 to DB9 cable (for console use)

Optional Accessories:

- WK-36-02: Wall mounting kit
- Mini DB9F-to-TB Adapter: DB9 female to terminal block adapter

Note

Notify your sales representative if any of the above items is missing or damaged.

Product Features

- Automatic Windows configuration utility
- Redundant dual DC power inputs
- Enhanced surge protection for serial and power
- 2 kV isolation for serial signals (-I model only)
- PROFIBUS connector to connect the gateway to the field bus
- Power-off warning by relay output
- Software-selectable RS-232/422/485 communication

Connecting Power

The unit can be powered using the AC adapter or by connecting a power source to the terminal block, depending on the model. The following instructions are for the AC adapter:

- 1. Plug the connector of the power adapter into the DC-IN jack on the back of the unit.
- 2. Plug the power adapter into an electrical outlet.

Follow these instructions to connect a power source to the terminal block:

- 1. Loosen or remove the screws on the terminal block.
- 2. Connect the 12–48 VDC power line to the terminal block.
- 3. Tighten the connections using the screws on the terminal block.

Note that the unit does not have an on/off switch. It automatically turns on when it receives power. The PWR LED on the top panel will glow to indicate that the unit is receiving power. For power terminal block pin assignments, please refer to the hardware reference chapter for your model.

Connecting PROFIBUS Devices

The unit's PROFIBUS port(s) are located on the front panel. Use a PROFIBUS cable to directly connect the unit to a PROFIBUS PLC or other PROFIBUS master.

For the PROFIBUS port pin assignments, please refer to Chapter 3. This information can then be used to construct your own PROFIBUS cable.

Connecting Modbus Serial Devices

The unit's Modbus port(s) are located on the front panel. Use a Modbus cable to directly connect the unit to a Modbus RTU/ASCII device.

For the Modbus port pin assignments, please refer to Chapter 3. This information can then be used to construct your own Modbus cable.

Connecting to a Host via Serial Console Cable

A RS-232 serial console port is located on the unit's front panel. This port is used for console configuration via a CBL-RJ45-F9-150 RJ-45-to-DB9 cable.

For normal operation, use a standard straight-through RS-232 serial cable to connect the unit to your COM port. You connect the unit directly to a PC. Besides, use a serial cable to connect the unit to your PC's serial connector.

The Tx/Rx LED of the console port will light up to indicate serial connection status when data is communicated with each other.

Power Input and Relay Output Pinouts

<u> </u>	V2+	V2-	٦]	V1+	V1-

Pin Assignments

Modbus P1 Pin Assignment

The MGate 4101-MB-PBS Series use DB9 (male) serial port to connect to Modbus devices.

Pin	RS-232	RS-422/ RS-485 (4W)	RS-485 (2W)
1	DCD	TxD-(A)	-
2	RXD	TxD+(B)	-
3	TXD	RxD+(B)	Data+(B)
4	DTR	RxD-(A)	Data-(A)
5	GND	GND	GND
6	DSR	-	-
7	RTS	-	-
8	CTS	-	-
9	-	-	-

PROFIBUS P2 Pin Assignment

The MGate 4101-MB-PBS Series use DB9 (female) serial port to connect to PROFIBUS devices.

PIN	Signal Name
1	N.C.
2	N.C.
3	PROFIBUS D+
4	RTS
5	Signal common
6	5V
7	N.C.
8	PROFIBUS D-
9	N.C.

Console (RS-232) Pin Assignment

The MGate 4101-MB-PBS Series use RJ45 serial port to connect to PC to configure device.

PIN	RS-232
1	DTR
2	RTS
3	GND
4	TXD
5	RXD
6	DCD
7	CTS
8	DTR

Mounting the Unit

The unit can be mounted on the wall or on a DIN-rail. The MGate 4101-MB-PBS/4101I-MB-PBS Series is designed to be attached to a DIN-rail or mounted on a wall. For DIN-rail mounting, push down the spring and properly attach it to the DIN-rail until it "snaps" into place. For wall mounting, install the wall mount kit (optional) first, and then screw the device onto the wall. The following figure illustrates the two mounting options:

Specifications

Note

The latest specifications for Moxa's products can be found at <u>https://www.moxa.com</u>.

Adjustable Pull High/Low Resistors for the Modbus Port (P1) in RS-485 Mode

In some critical environments, you may need to add termination resistors to prevent the reflection of serial signals. When using termination resistors, it is important to set the pull high/low resistors correctly so that the electrical signal is not corrupted. The MGate uses jumper settings or DIP switches to set the pull high/low resistor values for each serial port.

To set the pull high/low resistors to 150 K Ω , make sure that the two jumpers assigned to the serial port are not shorted by jumper caps. This is the default setting.

To set the pull high/low resistors to 1 K Ω , make sure that the two jumpers assigned to the serial port are shorted by jumper caps.

ATTENTION

Do not use the 1 K Ω setting on the MGate when using the RS-232 interface. Doing so will degrade the RS-232 signals and shorten the maximum allowed communication distance.

Reset Button

To reset the MGate to the factory default settings, hold down the reset button for about 5 seconds. The MGate will restart and be reset to factory default settings.

Rotary Switch

Before communication, you must assign a slave ID to the PROFIBUS slave, If you would like to assign an address between 0 to 99, you need to change the rotary switch to the desired address. If you would like to assign an address which is over 99, you must set it in the MGate utility.

Installing the Software

The following instructions explain how to install MGate Manager, a utility for configuring and monitoring MGate 4101-MB-PBS units over the network.

- Please download the MGate Manager software from Moxa's website at <u>http://www.moxa.com</u>. Then, locate and run the following setup program to begin the installation process: MGM_Setup_[Version]_Build_[DateTime].exe
 - (The latest version could have the following format: MGM_Setup_Verx.x.x_Build_xxxxxxx.exe.)
- 2. You will be greeted by the Welcome window. Click Next to continue.

3. When the Select Destination Location window appears, click Next to continue. You may change the destination directory by first clicking on Browse.

📴 Setup - MGate Manager
Select Destination Location Where should MGate Manager be installed?
Setup will install MGate Manager into the following folder.
To continue, click Next. If you would like to select a different folder, click Browse.
C:\Program Files\Moxa\MGate Manager Browse Browse
At least 0.9 MB of free disk space is required.
< <u>B</u> ack <u>N</u> ext > Cancel

4. When the Select Additional Tasks window appears, click Next to continue. You may select Create a desktop icon if you would like a shortcut to MGate Manager on your desktop.

🔂 Setup - MGate Manager	
Select Additional Tasks Which additional tasks should be performed?	
Select the additional tasks you would like Setup to perform while installing MGate Manager, then click Next. Additional icons : Create a desktop icon	
< <u>B</u> ack <u>N</u> ext >	Cancel

5. Click **Next** to start copying the software files.

🔂 Setup - MGate Manager
Ready to Install Setup is now ready to begin installing MGate Manager on your computer.
Click Install to continue with the installation, or click Back if you want to review or change any settings.
Destination location: C:\Program Files\Moxa\MGate Manager Additional tasks: Additional icons : Create a desktop icon
< <u>B</u> ack Install Cancel

6. A progress bar will appear. The procedure should take only a few seconds to complete.

🔂 Setup - MGate Manager	
Installing Please wait while Setup installs MGate Manager on your computer.	
Extracting files C:\WINDOWS\system32\drivers\mgdrv.sys	
	Cancel

7. A message will indicate that MGate Manager is successfully installed. You may choose to run it immediately by selecting Launch MGate Manager.

Starting MGate Manager

MGate Manager is a Windows-based utility that is used to configure the MGate 4101-MB-PBS.

Before running MGate Manager, make sure that the MGate 4101-MB-PBS is connected to your PC. Please refer to Chapter 2 for more details.

You may open MGate Manager from the Windows Start menu by clicking **Start > Programs > MGate Manager > MGate Manager**. The MGate Manager window should appear as shown below.

Change Language Setting

If you wish to run MGate Manager in a different language, you may click **Language** to change the language setting. A dialog box showing the available languages should appear as shown below.

Language	×
Chinese_Simplified.Ing	
English.Ing French.Ing	
German.lng Japanese.lng	
Korean.lng Polish.lng	
Default Language OK Cancel	

When you click **OK**, MGate Manager will immediately reflect your chosen language.

lGate	e Manager)[=
D.	Name	Model	MAC Address	IP/COM	Status	Firmware Version	1
Dev	vice Identification	Device	Function				
	Search		Configuration	Load Monitor Log	ProCOM Mapping	Import	
	Locate		Load Default	Diagnose	Upgrade Firmware	Export	
-	Language		D Management	Off-Line Configuration	ן	Exit	٦
					J	EXIC	

After changing to a different language, you will find that all strings on MGate Manager are replaced in your chosen language. For example, the above picture is shown in English. However, no matter what language you choose, it won't change the label on the language button.

ATTENTION

Set your MGate Manager to "Default Language" before contacting Moxa Technical Support.

With support for multiple languages, MGate Manager is more user-friendly and accessible. However, if you need assistance from Moxa Technical Support, please change the language to "Default Language". This will prevent any misunderstandings or confusion about MGate Manager menu items and commands as our engineers assist you.

The default language is English and will only be active for the current MGate Manager session. When you open MGate Manager again, the language will revert to your original setting.

Connecting to the Unit

Prior to configuration, MGate Manager must be connected to its unit. There are three methods to establish connection. Broadcast Search locates the MGate Series on the LAN. Search by IP attempts to connect to a specific unit by IP address, which is useful if the unit is located outside the LAN or can only be accessed by going through a router. Connect through COM port tries to connect to a separate unit via a RS-232 serial COM port.

Broadcast Search

Broadcast Search is used for MGate Ethernet Gateways, such as the MGate MB3000 and MGate EIP3000 Series, which are discovered via Ethernet by using broadcast IP. In addition, whenever you add an MGate 4101-MB-PBS via serial console, MGate Manager will automatically record the COM port(s) for the broadcast to search as well. Note that restarting MGate Manager will erase the COM port(s) record.

Specify by IP Address

Specify by IP Address is used for MGate Ethernet Gateways, such as the MGate MB3000 and MGate EIP3000 Series, which are discovered via Ethernet by using a specific IP address. Click **Specify by IP Address** if you know the IP address of the unit and wish to connect to it directly.

ATTENTION

If Search by IP Address fails to locate the MGate MB3000 or MGate EIP3000 Series, the IP address that you entered might be incorrect. Try doing the search again and re-entering the IP address carefully.

Another possibility is that the MGate MB3000 or MGate EIP3000 Series is located on the same LAN as your PC, but on a different subnet. In this case, you can modify your PC's IP address and or netmask so that it is on the same subnet as the MGate MB3000 or MGate EIP3000 Series. After your PC and the MGate MB3000 or MGate EIP3000 Series are on the same subnet, MGate Manager should be able to find the unit.

Connect through COM Port

Connect through COM Port is used for MGate PROFIBUS Gateways, such as the MGate 4101-MB-PBS Series, which are discovered via RS-232 serial COM Port. Click **Connect through COM Port** if you know the COM port number of the unit.

Search

Click **Search** to begin searching the serial console for the MGate 4101-MB-PBS units.

lo.	Name	Model	MAC Address	IP/COM	Status Firm	ware Version

Configure Device

In first page, you can change device name and select a password to protect the unit from unauthorized access.

Configuration		$\overline{\mathbf{X}}$
		Cancel
Device Modbus PR	OFIBUS IO Mapping	
Name	MG4101_3	
Password		
Confirm Password		
Parameter	Value Notes	ter a name to beln you identify the unit su

Parameter	Value	Notes
Name	(an alphanumeric string)	You can enter a name to help you identify the unit, such as the location, function, etc.
Password	(an alphanumeric string)	You can set a password to prevent unauthorized users from configuring the unit. The password will be required when anyone attempts to configure the unit over the network. Modbus operation is not affected by the password.
Confirm password	(an alphanumeric string)	Re-type the password again for confirmation.

ATTENTION

To erase an existing password, leave both the New Password and Confirm Password text input boxes blank. The password will be erased when you click OK in the bottom right corner.

Configure Modbus Settings

The Serial tab is where Modbus serial port's communication parameters are configured. You can configure Baud Rate, Parity, Stop Bit, Flow Control, FIFO, and Interface Mode.

Mode	Description
RTU Master	Modbus RTU server(s)/slave(s) will be connected to the serial port
RTU Slave	A Modbus RTU client/master will be connected to the serial port
ASCII Master	Modbus ASCII server(s)/slave(s) will be connected to the serial port
ASCII Slave	A Modbus ASCII client/master will be connected to the serial port

Serial Port	Description
	Supports standard baudrates (bps):
Baud Rate	50/75/110/134/150/300/600/1200/1800/2400/4800/7200/9600/19200/38400/
	57600/115200/230.4k/460.8k/921.6k
Parity	None, Odd, Even, Mark, Space
Data Bits	8
Stop Bits	1, 2
Flow Control	None, DTR/DSR, RTS/CTS
FIFO	Enable, Disable
Interface	RS-232, RS-422, RS-485 2-wire, RS-485 4-wire

Protocol	Description						
Slave ID	Slave mode only, Modbus server/slave identification number of the MGate 4101-MB-						
Slave ID	PBS						
Response Time-out	Master mode only, the time client/master will wait for a response after sending a						
(ms)	request. See detailed description below.						
Max Dates	Master mode only, the number of times the client/master will retry the same						
Max. Retry	request when response time out.						

Response Time-Out

According to the Modbus standard, the time that it takes for a server/slave device to respond to a request is defined by the device manufacturer (please refer to Appendix A of MGate MB3000 Series User Manual for details). Based on this response time, a client/master can be configured to wait a certain amount of time for a server/slave's response. If no response is received within the specified time, the client/master will disregard the request and continue operation. This allows the Modbus system to continue operation even if a server/slave device is disconnected or faulty.

On the MGate 4101-MB-PBS, the "Response Time-out" field is used to configure how long the gateway will wait for a response from a Modbus ASCII or RTU server/slave. Please refer to your device manufacturer's documentation to manually set the response time-out.

Set Up PROFIBUS

Every PROFIBUS slave device should be assigned a unique address in the same field. If the address you would assign is lower than 99, please use the rotary switches (decimal) on the top of device. If the address you would assign is higher than 99, please set the rotary switches as 99 and **Slave Address** field will be enabled for setting the designated address.

Configuration 🔀
PROFIBUS Master PROFIBUS Master PROFIBUS DP PROFIBUS DP
Device Modbus PROFIBUS IO Mapping
Slave Address 0 (Slave address less than 99 could only be set by the rotary switch)

PROFIBUS	Description
Slave Address	Before communication, you must assign a slave ID to the PROFIBUS slave, If you would like to assign an address between 0-99, you need to change the rotary switch to the desired address. If you would like to assign an address which is over 99, you must set it in the MGate utility. If you would like to use a slave address which is over 99, set the rotary switch to "99" and then use MGate Manager to configure the desired address.

Refer to chapter 3 for instructions on how to set the slave address using a rotary switch.

IO Mapping Setup

In this page, you should define all commands that Modbus uses and all I/O modules PROFIBUS slave provides.

If you choose MGate 4101-MB-PBS as Modbus Client/Master, you should designate all Modbus Read or Write requests in the table on the left.

Click **Add** to create each Modbus request.

QuickLi		ito Map						age1	 Paging
Name	(Read/Wr Enable		 Addr	Len	Inter Addr	Poll Inte	1		tput:0/0 bytes)
<						>			

Each Modbus request includes Name, Enable, Modbus slave ID, Function Code, Address, Length, Internal Address, Poll Interval, Swap, Fault Protection, Fault Timeout. Please refer to datasheets or manuals of Modbus server/slave devices to fill out these fields.

Modbus Request			
Name			
Enable	Cyclic	Length	10
Slave ID	1	Internal Address	0
Function Code	03:Read holding registers 🐱	Poll Interval (ms)	1000
Address	0	Swap	None
Fault Protection	Keep latest data 💉	Fault Timeout (ms)	60000
		(OK Cancel

Parameter	Description						
Name	Enter a name to help identify the command, such as the location, function etc.						
	The Enable for the transaction:						
	Disable: The transaction is never sent						
Enable	Cyclic: The transaction is sent cyclically at the interval specified in the "Poll Interval"						
Ellable	parameter.						
	Data change: The data area is polled for changes at the time interval defined by Poll						
	Interval. A transaction is issued when a change in data is detected.						
	The Modbus slave id that this server/slave module will accept.						
Slave ID	0: Broadcasting						
	1-255: Device specific						

Parameter	Description								
	When a message is sent from a Client to a Server device the function code field tells								
	the server what kind of action to perform.								
	We support the following function code by far:								
	01: Read coils								
	02: Read discrete inputs								
Function Code	03: Read holding registers								
	04: Read input register								
	05: Write single coil								
	06: Write single register								
	15: Write multiple coils								
	16: Write multiple registers								
Address	Station Address. The range is from 0 to 65535								
Length	Specifying the quantities to read or write.								
Length	The range for coil is from 1 to 1952, and for register from 1 to 122.								
Internal Address	This parameter specifies the location of the trigger byte in internal memory. The								
Internal Address	range is from 0 to 243.								
	Polling interval in millisecond, since the module sends all requests in turns, the								
Poll Interval (ms)	actual polling interval also depends on the number of requests in the queue and								
	their parameters. The range is from 10 to 1200000.								
	Data Byte Swapping								
	None: Don't need to swap								
	Byte: 0x0A, 0x0B, 0x0C, 0x0D becomes 0x0D, 0x0C, 0x0B, 0x0A.								
Swap	Word: 0x0A, 0x0B, 0x0C, 0x0D becomes 0x0C, 0x0D, 0x0A, 0x0B.								
Змар	ByteWord: 0x0A, 0x0B, 0x0C, 0x0D becomes 0x0D, 0x0C, 0x0B, 0x0A.								
	There are two phases in changing ByteWord								
	1). 0x0A, 0x0B, 0x0C, 0x0D becomes 0x0B, 0x0A, 0x0D, 0x0C.								
	2). 0x0B, 0x0A, 0x0D, 0x0C becomes 0x0D, 0x0C, 0x0B, 0x0A.								
	For the Modbus RTU master mode, the opposite side refers to the PROFIBUS side.								
	The Modbus write command is sent from the PROFIBUS. Once the PROFIBUS								
	connection fails, the gateway will not be able to receive the PROFIBUS command,								
Fault Protection	but the gateway will continuously send Modbus write commands to the Modbus RTU								
	server/slave device. To avoid problems when the PROFIBUS side fails, the MGate								
	4101 can be configured to react in one of three ways: keep latest data, clear data to								
	zero, and user-defined value.								
Fault Timeout	Defines the communication timeout for the PROFIBUS side. The range is from 0 to								
	65535 ms. (the default setting is 60000 ms.)								

Fault Protection

The Fault Protection function sends a predefined setting to field devices to prevent incorrect actions when an upstream connection is lost. You can configure the criteria used to determine what to do when the write command is no longer received from the PROFIBUS side. For example, when a PROFIBUS cable comes loose accidentally, the most up-to-date write command from the PROFIBUS side will not be received by the gateway. Hence, the Modbus client/master will continuously send Modbus write commands to the server/slave device, which is now out-of-date, creating an inconsistency between the PROFIBUS and Modbus sides. To avoid this problem, the MGate 4101 supports options to determine which actions should be taken when the PROFIBUS side is disconnected from the gateway.

Options	Description
Keep latest data	The gateway will write the same data to the server/slave device.
Clear data to zero	The gateway will write zero values to the server/slave device.
User-defined value	A user-defined value will be written to the server/slave device.

After adding a command, you find out that many similar commands with different slave IDs need to be configured. You can choose (Ctrl + click-left) desired commands and press Clone to duplicate commands.

Modbus (Read/Write:12/2 bytes)										
Name	Enable	SID	Func	Addr	Len	Inter Addr	Poll			
Command1	Cyclic	1	3	0	2	0	100			
Command2	Cyclic	1	3	2	4	4	100			
Command3	Cyclic	1	6	0	1	40000	100			
<							>			
Add Re	move	Edit	Clon	e	Jp	Down				

Then, a dialog box that is used to set the desired Slave ID will appear. The Slave ID range could be set and then click \mathbf{OK} to produce commands.

Clone Mo	dbus Request	X			
Slave ID	2	(ex: 1,3,5-11)			
	ОК	Cancel

<							>			
Add Re	move	Edit	Clon	e 🗌	Jp	Down				

After all Modbus requests finish, all the data collected from Modbus should be mapped to PROFIBUS I/O modules for the PROFIBUS Master to use.

Click **Add** to create each PROFIBUS I/O module in the table on the right.

Device Modt	ous PRO	FIBUS	IO Ma	pping								
QuickLink Auto Mapping Page1 Paging												
Modbus (Read/Write:12/2 bytes) PROFIBUS Slave (Input/Output:0/0 bytes)												
Name	Enable	SID	Func	Addr	Len	Inter A	Poll		Name	I/O Mod	CID	Inter Addr
Command1 Command2	Cyclic	1	3	0 2 10	2 4	0 4	1000					
Command3	Cyclic	1	6	10	1	40000	1000					
<							>					
Add Re	move	Edit	Clon	e 🗍	Jp	Down		ſ	Add	Remove	Edit	Up Down
								-				

Then, a dialog which is used to set up the IO module will appear, please adjust the parameters which correspond with the Modbus requests you set before. Click **OK** to record this IO module.

PROFIBUS IO Module								
Name								
I/O Туре	Input 💌							
Data Type	Word 🔽							
Data Length	1							
OK Cancel								

Parameter	Description
Name	Enter a name to help identify the module, such as the location, function etc.
	Input: Used to map into input memory
I/О Туре	Output: Used to map into output memory
Data Type	The data type for this IO module
Data Length	The data length for this IO module. The range is from 1 to 64.

Finally, you can see the IO module you configure before is put into PROFIBUS Slave list.

PROFIBUS Slave (Input/Output:12/0 bytes)										
Name	I/O Mod	CID	Inter Addr							
[Input1	Input:6 words	0x55	0							
Add	Remove Edit	: [[Jp Down							

Follow the steps above; you can map all of the Modbus requests you need into IO module.

If you would like to check if the I/O map is totally correct, you could click **PROFIBUS I/O module** that will show what Modbus commands are included in the table on the right. After finishing the configuration, MGate 4101-MB-PBS can communicate between the PROFIBUS and Modbus protocols.

Modbus (Rea	Modbus (Read/Write:12/2 bytes)								PROFIBUS Slave (Input/Output:12/2 bytes)

ΝΟΤΕ

Each "Name" of the commands must be mapped, that is, the commands in Modbus will correspond with the I/O module in PROFIBUS.

Auto Mapping

Auto Mapping is a useful function that can help you map Modbus commands to PROFIBUS I/O modules easily. This function is for Modbus master mode only. Typically, users need to spend lots of time in setting I/O modules. By using the Auto Mapping function, it will map Modbus commands to PROFIBUS I/O modules automatically. You can map it in one of three ways: All-in-one, One-to-one, or by Slave ID.

QuickLink	Auto N							age1 IS Slave (To	out/Or	Paging
Name	Enable		Func	Addr	Len	Int	Poll Inte			Inter Addr
Command1	Cyclic	1	3	0	2	0	1000			
Command2	Cyclic	1	3	2	4	4	1000			
Command1	Cyclic	2	3	0	2	12	1000			
Command2	Cyclic	2	3	2	4	16	1000			
<							>			

Click the **Auto Mapping** function. Then, a dialog box that is used to select the package types will appear. Please select one of them to map Modbus commands. Click **OK** to produce PROFIBUS I/O modules.

Auto Mapping 🛛 🔀
Warning:
Auto mapping will rearrange Modbus commands and reset PROFIBUS modules.
Package Type
⊙ All-in-one
🔘 One-to-one
O By slave ID
OK Cancel

Package Type	Description
All-in-one	Combine all the Modbus read/write commands to PROFIBUS one input/output module respectively.
One-to-one	Combine each Modbus read/write command to PROFIBUS each input/output module respectively.
By slave ID	Combine Modbus read/write commands by slave ID to PROFIBUS input/output modules respectively.

QuickLink

The QuickLink is an innovative function to let you configure more quickly and easily, Typically, most PROFIBUS users must spend a lot of time to set up Modbus commands in a PROFIBUS application. By using the QuickLink function, the MGate 4101-MB-PBS will learn Modbus requests automatically to save time in deployment. However, the function is only enabled in Modbus master mode. (Please refer to the Typical Application in the Appendix for more details). Start QuickLink by clicking the **QuickLink** button.

Device 1	Modbus	PROFI	BUS IC) Mappir	ng							
QuickLi	ink Au	ito Map	ping						P	age1		Paging
Modbus	(Read/Wr	ite:0/0	bytes)					PROF	FIBL	IS Slave (In	put/Ou	tput:0/0 bytes) —
Name	Enable	SID	Func	Addr	Len	Inter Addr	Poll Inte	Nar	ne	I/O Mod	CID	Inter Addr
<							>					
Add	Remove	Ec	dit 🗍	Clone	Up	Down		Add		Remove	Edit	Up Down

It takes some time to learn the Modbus requests. Begin by clicking the Start button, which will change the status to On Learning. The number of Learned Requests will increase as the MGate 4101-MB-PBS learns each request. When you are sure all the requests have been learned by the MGate 4101-MB-PBS, click the Stop button, then click the Next button to continue QuickLink.

NOTE

QuickLink function will work correctly only when all the serial parameter settings are set correctly.

Time: 00:00:10		Stop		
Item Status Learned Requests Found Invalid Reque. Requests Overflow	Value On Learning 0 No No			

The interface of the next dialogue box is divided into two sections. The upper section is labeled Modbus and will display the details of the Modbus requests which have been learned by the MGate 4101-MB-PBS. The lower section is labeled PROFIBUS Slave and will display the I/O module. Moreover, based on these learned requests, the I/O module blocks are allocated intelligently by MGate Manager. To complete the process, click the Finish button to make the settings work.

None

Paging

Gateway internal memory is divided into two blocks. The input memory address starts from 0x00000, and the out memory starts from 0x40000. The following picture demonstrates the memory structure. Each page contains 244 bytes.

Input refers to the dataflow from the Modbus device to the PROFIBUS master. More specifically, it means the gateway will read the Modbus device's data and store in its input memory area. And the PROFIBUS master will read these Modbus data stored at the gateway's input memory. Users can choose internal memory address between 0 to 224.

Output refers to the dataflow from the PROFIBUS master to the Modbus devices. The PROFIBUS data that are being written to the Modbus device will be stored at the gateway's output memory area, and then the Modbus device will write those data stored at the gateway's output memory area. Users can choose internal memory address between 40000 to 40242.

If you want to exchange data over 244 bytes, you can select the **Paging** checkbox to enable the page function, so the utility will insert two I/O word modules into the starting location of the input/output memory bank for separate page functionality. Basically, because one I/O module supports 244 bytes only, the paging function can be used to break through this limit. The maximum of input/output memory size is up to 7744 bytes respectively.

The output I/O module, which is called P1, is used to change the page number to the specified one. The first byte of module P1 attempts to switch input page number, and the second byte attempts to change output page number. In addition, the input I/O module, which is called P2, is used to read the current page number. The first byte of module P2 indicates input page number and the second one designates output page number. You can't modify these two I/O modules.

F	age1	~ [Paging
PROFIBU	JS Slave (Input/O	utput:2	6/2 bytes)
Name	I/O Mod	CID	Inter Addr
P1 P2	Output:1 word Input:1 word	0x60 0x50	40000 0
SID 1 SID 2	Input:6 words Input:6 words	0x55 0x55	2 14
Add	Remove Edit		p Down

Load Default

If for some reason you would like to clear all the settings of the unit, the **Load Default** button will reset the unit to its initial factory default values.

Name	Model	MAC Address	IP/COM	Status Firmw	are Version
MG4101_66	MGate 4101-MB-PBS	N/A	COM58	Ver. 1.	3 Build 14031018
Device Identification	- Device Fur	action			
Search	(figuration	Monitor	ProCOM Mapping	Import
Locate	Loa	d Default	Diagnose	Upgrade Firmware	Export

Click **Load Default** and review the confirmation message.

If you are sure you would like to reset the configuration to the factory default, click the **OK** button. If not, click **Cancel**.

After MGate Manager resets completely, it will automatically execute a Broadcast Search for all MGate units on the LAN and the recording COM port. Your MGate should reappear in the list of units.

ATTENTION

Load Default will completely reset the configuration of the unit, and all of the parameters you have saved will be discarded. Do not use this function unless you are sure you want to completely reset your unit.

Monitoring Modbus Activity

For troubleshooting or management purposes, you can monitor the data passing through any MGate 4101-MB-PBS on the Modbus side. Data events will be logged as they pass through the gateway. Rather than simply echoing the data, MGate Manager presents the data in an intelligent, easily understood format, with clearly designated fields including source, type, destination, contents, and more. Events can be filtered in different ways, and the complete log can be saved to a file for later analysis.

The dialog box will show the details of the communication status of Modbus, PROFIBUS, and I/O Data View. In addition, it contains serial parameters.

dbus PRC	FIBUS I/O Data Vi	ew		
Category	Item	Value		
Modbus				
	State	Running		
	Туре	RTU Master		
	Valid Requests	4593		
	Exception	0 102 5		
	Timeout			
	CRC/LRC Error			
	Invalid Requests	0		
Serial Port				
	Port Number	1		
	Interface	RS485 2-wire		
	Settings	19200,None,8,2		
	TX	45270		
	RX	33728		
	Break	0		
	Frame Error	0		
	Parity Error	0		
	Overrun Error	0		

There are two parts. In Modbus tab, the first part is the information regarding Modbus. These details will help you to analyze the Modbus communication.

Modbus	Description
State	The communication state of Modbus side
Туре	RTU Slave / RTU Master / ASCII Slave / ASCII Master
Slave ID	The Slave ID for Modbus
Valid Requests	The number of valid requests
Exception	The number of exceptions
Time-out	The number of time-outs
CRC/LRC Error	The number of CRC/LRC errors
Invalid Requests	The number of invalid requests

The second part is the serial parameters. It includes the serial communication about this serial port

Serial Port	Description
Port Number	The serial port number
Interface	The serial interface, RS-232/RS-422/RS-485-2w/RS-485-4w
Settings	The parameter includes baudrate, parity, start bit and stop bit, for example, 19200,
Settings	None, 8, 1
Tx	The transmission count
Rx	The reception count
Break	The number of break signals
Frame Error	The number of frame errors
Parity Error	The number of parity errors
Overrun Error	The number of overrun errors

The PROFIBUS tab has information about the PROFIBUS status

odbus PRO	FIBUS I/O Data View	
Category	Item	Value
PROFIBUS		
	State	Data Exchange
	Baudrate	1500000 bps
	Address	3
	Ouput	4 bytes
	Input	4 bytes
	Illegal I/O Config	0
	Restart Data Excha	0

PROFIBUS	Description
State	The communication state of PROFIBUS side
Baudrate	The baudrate of PROFIBUS side
Address	The PROFIBUS segment ID
Output	The output bytes
Input	The input bytes
Illegal I/O Config	The number of illegal I/O configurations
Restart Data Exchange	The number of restarted data exchanges

The I/O Data View tab is designed to check all exchanging data in MGate's internal memory. Select **PROFIBUS I/O module/Modbus** command to obtain the correct data.

Upgrading Firmware

Firmware updates for the MGate 4101-MB-PBS are located at www.moxa.com. After you have downloaded the new firmware onto your PC, you can use MGate Manager to write it onto your MGate 4101-MB-PBS. Select the desired unit from the list in MGate Manager and click **Upgrade Firmware** to begin the process.

lGate	e Manager					
lo.	Name	Model	MAC Address	IP/COM	Status	Firmware Version
1	MG4101_66	MGate 4101-MB-PBS	N/A	COM58		Ver. 1. 3 Build 14031018
	1					
Dev	vice Identification	Device Fu	nction			
	Search	Con	figuration	Monitor	ProCOM Mapping	Import
	Locate	Loa	d Default	Diagnose	Upgrade Firmware	e Export
					J <mark></mark>	
	Language	GSD M	lanagement	Off-Line Configuration		Exit
-						

The dialog boxes will guide you through the process. You will need to browse your PC for the firmware file. Make sure that it matches your model.

Upgrade Firmware	
Firmware for 4101-MB-PBS/4101I-MB-PBS	l
1B-PBS\Firmware\mg4101_Ver1.1_Build_11112119.ron ¹	Browse
2.	
ок	Cancel

As the firmware is written to the unit, progress is displayed in the window.

Jpgrade Progress						
No.	Model	MAC Address	IP/COM	Status		
01	MGate 4101-MB-PBS	N/A	COM1	Transmit 40%		
				Exit		

Once the firmware has been successfully written onto the unit, click **Exit** to close the Upgrade Firmware window. MGate Manager will automatically execute a Broadcast Search for all MGate units on the LAN and the recording COM port. Your MGate should reappear in the list of units.

Import/Export

The Import/Export configuration function is a convenient way to apply the same settings to units which are located in different sites. You can export the configuration as a file, and then import that configuration file onto other units at any time.

The export function saves all the configuration settings and parameters of the MGate 4101-MB-PBS will be saved in an .INI file format. Furthermore, you also can save a GSD file with all I/O module settings in a .zip file.

To begin, click the **Export** button.

b .	Name	Model	MAC Address	IP/COM	Status	Firmware Version
	MG4101_66	MGate 4101-MB-PBS	N/A	COM58		Ver. 1.3 Build 14031018
De	vice Identification	Device Fur	nction			
	Search	Con	figuration	Monitor	ProCOM Mapping	Import
	Locate	Loa	d Default	Diagnose	Upgrade Firmware	e Export
1	Language		lanagement	Off-Line Configuration	7	Exit

Type in a file name and use the **Browse** button to set the save file to a specific path. Then, click the **OK** button.

Save/Load		
Configuration	cuments and Settings\CT\Desktop\configure.ini	Browse
GSD	C:\Documents and Settings\CT\Desktop\GSD.zip	Browse
	ОК	Cancel

If you export the configuration/GSD file successfully, a confirmation message will pop up.

After that, the configuration file will be saved as an .INI file

The GSD file will be saved as a .zip file.

The exported GSD file is used for easy configuration when setting PLC. Typically, users waste lots of time in importing MGate 4101 general GSD files and then set the I/O modules respectively. If we import the specified GSD coming from MGate 4101, a user just needs to pull the module to the PROFIBUS system. Then the I/O modules will be set and you can run the communication. It is an easy and efficient way in PLC configuration.

2. OK Cancel	

Please be patient and wait as MGate Manager configures the target device.

Process Progress	
Setting device(s) configurations	

If you import the configuration file successfully, a confirmation message will pop up.

After closing the message dialog box, MGate Manager will automatically execute a Broadcast Search for all MGate units on the LAN and the recording COM port. Your MGate should reappear in the list of units.

Off-Line Configuration

Users can create or modify the configuration file manually through MGate Manager. To use this function, users can click on the **Off-Line Configuration** button to load the configuration window.

No.	Name	Model	MAC Address	IP/COM	Status	Firmware Version
01	MG4101_66	MGate 4101-MB-PBS	N/A	COM58		Ver, 1, 3 Build 14031018
De	evice Identification	Device Fu	nction			
	Search	Con	figuration	Load Monitor Log	ProCOM Mapping	Import
	Locate	Loa	d Default	Diagnose	Upgrade Firmwar	e Export
	Locate	Loa	d Default	Diagnose	Upgrade Firmwar	e Export

A dialog box will appear. Choose the correct model and series. Click the **OK** button for the desired MGate device to proceed to the next step.

Select Mod	el
Series	MGate 4000
Model	MGate MB3000 MGate EIP3000
	MGate 4000 MGate 5000

Users can choose "Create new configuration" or "Load existing configuration" to create or modify configurations.

MGate 4101-MB-PBS	
Create new configuration Load exist configuration	
OK Cancel	

By choosing "create new configuration," users can set each functions as online setting. Refer to the **Modifying the Configuration** section for detailed information. When all configurations are finished, click **OK** to update or store the configuration file.

A dialog box to store the configuration file as *.INI file is displayed.

Save As							? 🗙
Save in:	📋 My Document	\$	~	G	ø	P 🗉	-

My compater	File name:	*.ini				*	Save
	Save as type:	Configuration File(*.ini)				*	Cancel
My Network							

The file for "Load existing configuration" can be generated from the **Export** function, or loaded from the file stored when "Create new configuration."

Typical Applications

Here is a typical application to demonstrate how to use the ${\bf Quick\ Link}$ function and explain how QuickLink works.

First, we are assuming a legacy Modbus client/master is in the original application, and the Modbus client/master is running. After MGate 4101-MB-PBS connects to the Modbus client/master, the MGate 4101-MB-PBS acts as a Modbus server/slave to learn Modbus requests from the client/master automatically.

After some time, MGate 4101-MB-PBS will fully learn the requests from the Modbus client/master. Through this QuickLink process, the MGate 4101-MB-PBS can replace the legacy Modbus client/master. Moreover, the MGate 4101-MB-PBS can respond to all of the Modbus servers/slaves correctly.

NOTE

QuickLink is enabled with the MGate 4101-MB-PBS is in master mode only. Please set the MGate 4101-MB-PBS in master mode before you use the QuickLink function.

Quick Configuration Steps

MGate 4101-MB-PBS provides an innovative function which can automatically and quickly finish the configuration. Two typical architectures are illustrated below. Confirm which architecture is used in your application and then follow the steps to finish the configuration.

MGate 4101 is Modbus Client/Master

MGate 4101 is Modbus Server/Slave

PROFIBUS Overview

Introduction

PROFIBUS (Process Field Bus) is a standard for fieldbus communication in automation technology and was first promoted in 1989 by BMBF (German department of education and research).

Topology

PROFIBUS uses the bus topology. In this topology, a central line, or bus, is wired throughout the system. Devices are attached to this central bus. One bus eliminates the need for a full-length line going from the central controller to each individual device.

In the past, each PROFIBUS device had to connect directly to the central bus. Technological advancements, however, have made it possible for a new "two-wire" system. In this way, multiple PROFIBUS buses can connect to each other.

Modbus Overview

Introduction

Modbus is one of the most popular automation protocols in the world. It supports both serial and Ethernet devices. Many industrial devices, such as PLCs, DCSs, HMIs, instruments, meters, motors, and drivers, use Modbus as their communication standard.

Devices are Either Clients/Masters or Servers/Slaves

All Modbus devices are classified as either a client/master or a server/slave. Client/Masters initiate all communication with server/slave and do not communicate with other clients/masters. Servers/Slaves are completely passive and communicate only by sending a response to a client/master's request.

Slaves are Identified by ID

Each Modbus server/slave in a system is assigned a unique ID between 1 and 247. Whenever a client/master makes a request, the request must include the ID of the intended recipient. Client/Master devices themselves have no ID.

0	1~247	248~255
Broadcast address	Server/Slave individual address	Reserved

Communication is by Request and Response

All Modbus communication is by request and response. A client/master sends a request, and a server/slave sends a response. The client/master will wait for the server/slave's response before sending the next request. For broadcast commands, no response is expected. This is illustrated by the following scenarios:

Normal

The client/master sends a request to the server/slave. The server/slave responds with the requested information.

Exception

The client/master sends a request to the server/slave. The server/slave may not support the command or an error is detected, so it sends an exception to the client/master.

Broadcast

The client/master sends a broadcast command, such as a reset command. Every server/slave on the network complies with the command, and no response is sent to the client/master.

Requests Need a Time Limit

The original Modbus protocol was not designed for simultaneous requests, so only one request on the network can be handled at a time. When a client/master sends a request to a server/slave, no other communication may be initiated until after the server/slave responds. The Modbus protocol specifies that clients/masters use a response timeout function to identify when a server/slave is nonresponsive because of device or line failure. This function allows a client/master to give up on a request if no response is received within a certain amount of time. This is illustrated as follows:

Response Timeout

The client/master sends a request. The server/slave is unresponsive for the amount of time specified by the response timeout function. The client/master gives up on the request and resumes operation, allowing another request to be initiated.

To allow for a wide range of devices, baudrates, and line conditions, actual response timeout values are left open for manufacturers to determine. This allows the Modbus protocol to accommodate a wide range of devices and systems. However, this also makes it difficult for system integrators to know what response timeout value to use during configuration, especially with older or proprietary devices.

The MGate MB3000 provides a patent-pending function that tests all attached devices and recommends a response timeout value. This function saves considerable time and effort for system integrators, and it results in more accurate timeout settings.

Modbus Ethernet vs. Modbus Serial

Although Modbus is intended as an application layer messaging protocol, the data format and communication rules for Ethernet-based Modbus TCP are different from serial-based Modbus ASCII and RTU.

The major difference between the Ethernet and serial Modbus protocols is the behavior of the communication model. Modbus ASCII and RTU allow only one request on the network at a time. Once a request is sent, no other communication on the bus is allowed until the server/slave sends a response, or until the request times out. However, Modbus TCP allows simultaneous requests on the network, from multiple clients/masters to multiple servers/slaves. TCP clients/masters cannot send more than one request at a time to a server/slave, but they can send requests to other servers/slaves before a response is received. The Modbus TCP standard recommends that servers/slaves be able to queue up to 16 requests at a time. The MGate MB3000 will queue up to 32 requests from each TCP client/master, for up to 16 TCP clients/masters.

Integrate Modbus Serial and Ethernet with Gateways

Ordinarily, Modbus TCP and Modbus ASCII/RTU are unable to communicate with each other.

However, with a Modbus gateway in between the Modbus serial network and the Modbus Ethernet network, TCP clients/masters are able to communicate with serial servers/slaves and serial clients/masters are able to communicate with TCP servers/slaves.

Diagnose Packet Format

When the communication of MGate works well between PROFIBUS and Modbus protocols, MGate won't go into diagnostic mode. However, if there is an error in the Modbus connection, for example, a disconnection or no responses, the MGate will continue to send polling requests until three requests are sent without response. Then, it will enter diagnostic mode. In this mode, the MGate will send diagnose packets periodically. Upon receiving the correct response, MGate will go back to normal operations.

Refer to the diagnose packet format table to help identify why the MGate entered diagnostic mode.

Byte	Parameter	Notes
1	Length	The length of diagnose packet
2	Page number	The paging number which the problem data locates
3	Module	The PROFIBUS IO module number which the problem data locates

For instance, if the diagnose packet is 03 01 03, that means the problem data is located on the third PROFIBUS IO module in page one. Using this information, you can check if the location of the internal memory is correct.
